# Django, `urls.py`

- Let's write one url rule

```python
16    from django.contrib import admin
17    from django.urls import path
18    from projeto5_website import views
19
20    urlpatterns = [
21        # Minha primeira view
22        path('', views.home, name='home'),
23
24        path('admin/', admin.site.urls),
25    ]
26
```

- **`url`** is a function call that builds url patterns

- **`^$`** is the regex for "I didn't get nothing"

- **`<project>_website.views.home`** is the Python importing string to get a view

- the name of a url lets us figure out which urls go where later on

- more details: https://docs.djangoproject.com/en/4.0/topics/http/urls/

# Django, #2 views

- A view is Python code that takes a `request` object and returns a `response` object.

- Sound familiar?
